Written Project Description

My partner and I will have to create an interactive story we wrote for english. The interactive story allows the person to interact with the story by choosing choices that are set out for them. The story will first have 3 choices for each person to choose and then it will branch out differently depending on the choices the person makes. Each partner will be required to contribute to both the story and the code. We are required to create a flowchart on lucid that presents the storyline and choices that will be given to the reader and the outcome that changes the entire story with each decision and continues until the story reaches it ending. The flow chart should also have multiple endings to give the reader multiple alternatives of the story. We will need to make sure our code has the correct format. We will use arrays and objects to store the story choices what the user chooses. For the code, we will have to make sure to comment on the code so the person reading it will understand what it's supposed to do. We have to have

descriptive name for all the functions so people can tell what the functions are doing.
